

FOR-REPRO STALLION & FOR-RECOVERY TECHNICAL SHEET

HOW TO USE

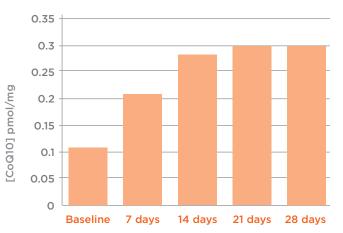

Foran Equine FOR-REPRO Stallion and FOR-RECOVERY provide an essential feed material Ubiquinol CoQ10 to horses, for normal body function. The products utilise the natural antioxidant and energy production activity of Ubiquinol CoQ10 to help maintain optimal body function and performance.

Ubiquinol CoQ10 is vital for normal body function and is especially beneficial for:

- Horses with limited access to natural sources of CoQ10 and that have a higher nutritional need for Ubiquinol CoQ10 as a result of their competitive lifestyle
- Stallions, especially those that are:
- Older or aging
- Busy, with a full stud book
- Young and unproven
- Known to have fertility issues
- Competing and collecting
- Shuttle stallions, moving between the northern and southern hemispheres
- Having semen collected for Al use where quality may be adversely affected by the cooling and/or freezing processes that are necessary for preservation and transport

WHEN TO GIVE:

FOR-REPRO Stallion and FOR-RECOVERY should be used at least 21 days prior to when Ubiquinol CoQ10 support is first needed to ensure that peak levels of CoQ10 are reached, when required:

COQ10-UBIQUINOL IN BLOOD PRE & POST 1G/DAY

For performance horses, this start point will fall within or even before the training period, depending on when Ubiquinol CoQ10 support is required for varying intensities of training, as well as competitive appearances.

For stallions, the start point is at least 21 days prior to first service as the beneficial effects of Ubiquinol CoQ10 apply to mature sperm.

FOR-REPRO Stallion and FOR-RECOVERY should be fed daily throughout the competitive or breeding season, as discontinuation causes a progressive decline in Ubiquinol CoQ10 levels.

HOW TO GIVE

FOR-REPRO Stallion and FOR-RECOVERY come in individual sachets for easy administration, accurate dosing and consistent quality, every day.

FOR-REPRO Stallion:

Add the contents of one sachet to the horses normal feed each day and mix well before feeding. **FOR-RECOVERY:**

Add the contents of 2 sachets to the horses normal feed daily for 10 days, then add the contents of 1 sachet to the horses normal feed daily thereafter for maintenance. Mix well before feeding.

FOR-RECOVERY is provided as a 30-day supply to allow flexibility for all training and competitive programs.

FOR-REPRO Stallion is provided as a six-month supply to maintain optimal stallion performance throughout his season.

FAQS

When do I start giving FOR-RECOVERY to optimize training?

FOR-RECOVERY should be used at least 21 days prior to when results are first needed, this is usually 21 days before heavier training commences. This ensures that peak levels of Ubiquinol CoQ10 have already been reached, when needed. Please contact a member for the Foran team, who will be happy to discuss and provide advice for your specific requirements.

Is there any benefit to continued administration once my stallion has finished his season?

FOR-REPRO Stallion is provided as a six-month supply to maintain optimal stallion performance throughout his season. This allows for FOR-REPRO Stallion to be fed for 21 days prior to his first service. Depending on the length of season, feeding can be continued after covering finishes to maintain optimal body function during recovery.

My horse was given more than one sachet of FOR-RECOVERY/FOR-REPRO Stallion in a day,

should I be worried?

Ubiquinol CoQ10 is naturally part of a horse's diet and therefore is very safe, even when given at high levels. Continue giving one sachet in feed the next day.

My horse missed a day of FOR-RECOVERY/FOR-REPRO Stallion, what should I do?

Continue giving one sachet in feed the next day. The decline in Ubiquinol CoQ10 concentration is progressive so one day missed will only slightly impact Ubiquinol CoQ10 levels.

My horse is a fussy eater or never finishes feed, how can I ensure it is eaten?

A sachet of FOR-RECOVERY and FOR-REPRO Stallion can be dissolved in water and given orally via a dosing syringe if required.

Feeds are made up in advance, is this a problem?

Ideally once FOR-RECOVERY/FOR-REPRO Stallion has been mixed with feed it should be fed promptly to the horse. If this is not possible the sachet should be added and mixed with the premade feed just prior to feeding.
